PROJECT PROPOSAL

Labour Management System (LMS)

A mobile application connecting skilled and unskilled workers with recruiters

Project type	Mobile application
Business model	Labour and recruitment marketplace
Technology	Flutter (app frontend) and Java (backend)

Prepared as a concise project proposal for review and planning.

1. Introduction

The Labour Management System (LMS) is a mobile application designed to connect skilled and unskilled workers with recruiters, companies, and contractors. It will help recruiters find suitable labour and allow workers to discover relevant job opportunities. The app will keep worker information, job requirements, applications, attendance, and payment records organized in one place.

2. Problem Statement

Finding suitable labour through traditional methods can take time. Recruiters may struggle to find workers with the required skills, experience, and availability, while workers may have limited access to suitable opportunities. The LMS aims to simplify recruitment by bringing workers and recruiters together through one application.

3. Objectives

- Maintain records of skilled and unskilled workers.
- Register recruiters and companies.
- Allow recruiters to post jobs and submit labour requirements.
- Match workers with jobs based on skills, location, experience, and availability.
- Manage job applications and worker assignments.
- Maintain attendance and payment records.
- Reduce recruitment time and improve communication.

4. Main Features

- **Labour Module:** Workers can register, create profiles, add skills and experience, specify wage expectations, and apply for jobs.
- **Recruiter Module:** Recruiters can create company profiles, post jobs, search for workers, and select suitable candidates.
- **Admin Module:** Administrators can manage users, review records, monitor recruitment activities, and generate reports.
- **Worker Matching:** The app will identify available workers who fit recruiters' requirements.
- **Attendance and Payment Records:** The system will record working hours, agreed wages, and payment status. Payments will be handled outside the application.

5. How the System Works

- Workers and recruiters register in the app.
- Workers complete their profiles with skills and experience.
- Recruiters submit job details and labour requirements.
- The system identifies suitable available workers.
- Recruiters review and select candidates.
- Worker assignments and attendance are recorded.
- Payment information is updated for recordkeeping.

6. Technology Stack

- **Mobile frontend: Flutter** — used to build the application interface and screens.
- **Backend: Java** — used for application logic, business rules, and APIs.
- **Database:** A database will store user profiles, job posts, applications, attendance, and payment records. The final database can be selected during technical planning.
- **Authentication:** Secure login and role-based access for workers, recruiters, and administrators.
- **Hosting:** A suitable cloud server will host the Java backend and support app connectivity.

7. Expected Benefits

The system will save time, organize labour records, simplify recruitment, improve worker matching, and provide better visibility into job assignments. It will help companies manage workforce requirements more efficiently and give workers an accessible way to find relevant opportunities.

8. Conclusion

The Labour Management System will provide a simple way to connect workers with recruiters through a mobile application. Using Flutter for the app interface and Java for backend services, the project will bring labour information and recruitment activities together in one place. It will begin with essential features and can be expanded in the future according to business needs.
